

ABSTRACT OF THE DISCLOSURE

A rubber roller (1) is formed by molding an elastomer composition not less than $250\mu s$ nor more than $400\mu s$ in a T2 relaxation time (spin-spin relaxation) of a bound rubber
5 formed between a rubber or/and a thermoplastic elastomer and a reinforcing filler. It is preferable to use EPDM as the rubber or/and the thermoplastic elastomer, carbon black as the reinforcing filler, and crosslink the EPDM with an organic peroxide. It is also preferable that the T2
10 relaxation time (spin-spin relaxation) of the bound rubber formed between the rubber or/and the thermoplastic elastomer and the reinforcing filler is more than a T2 relaxation time of a bound rubber of the rubber or/and the thermoplastic elastomer to which the reinforcing filler is not added by not
15 less than 150% nor more than 300%.
